PREFACE

For some years past, the World Climatology Branch of the Meteorological Office has compiled climatic tables for places all over the world and sold many thousands of copies each year to industrial firms and agencies and to individual inquirers. To meet this need, tables for a carefully chosen and representative selection of places are here presented in book form, making data for the whole world readily available at a moderate cost.

The places are grouped into six volumes:-

- I North America, Greenland and the North Pacific Ocean
- II Central and South America, the West Indies and Bermuda
- III Europe and the Atlantic Ocean north of 35°N.
- IV Africa, the Atlantic Ocean south of 35°N. and the Indian Ocean
- V Asia
- VI Australasia and the South Pacific Ocean, including the corresponding sectors of Antarctica.

Volumes I to VI will also be published in one composite volume

A world outline map appears as the frontispiece in each volume and shows the actual boundaries of the broad regions covered by the various parts. One further map in each volume shows the positions of the places for which climatic tables are given.

Acknowledgment is due to the Permanent Committee on Geographical Names for their work in checking the spelling of all the names used in this publication.

Thanks are also due to the Meteorological Service, Commonwealth of Australia for previously unpublished data specially prepared for this work.

EXPLANATORY NOTES

Temperature

The temperature values given in the tables are air temperatures taken in the shade, the thermometer being mounted inside a special screen at 4-6 ft. above ground level.

Thermometer screens are designed to permit a free circulation of air around the bulb and yet to afford shelter from precipitation, the direct rays of the sun, and from heat radiated from the ground and neighbouring objects. Measurement under these conditions results in a close approximation to the true air temperature in most circumstances.

The highest and lowest temperatures recorded during the 24 hr. are known, respectively, as the daily maximum and daily minimum temperatures. The averages of these for each month and for the whole year are given in columns 1 and 2 of the tables. An approximation to the overall mean temperature for any month may be obtained by computing $\frac{1}{2}$ (average daily maximum + average daily minimum). The extreme values in each month of the daily maximum and minimum temperature are known as the monthly maximum and monthly minimum respectively; averages of these values are given in columns 3 and 4, except that the entries for the year (at the foot of each of these columns) are averages of the highest and lowest temperatures recorded in each year, regardless of month of occurrence. The entries in columns 5 and 6 are the absolute extremes which have occurred during the entire period of observational record used in the table for each place.

Relative humidity

Measurements are normally made at fixed hours of observation, and, as a rule, it is impracticable to give maximum and minimum relative humidity or values at the time of minimum and maximum temperature. For most stations, therefore, columns 7 and 8 provide averages at specified hours in the morning and afternoon respectively. Where a choice has been possible, the values are for those hours nearest to the normal times of minimum and maximum temperature, i.e. just before sunrise and in the early afternoon. Values at the morning hour of observation are mostly a little lower than the maximum relative humidity, the difference depending on the difference in time between the hour of observation and sunrise and on which is the earlier. Values at the afternoon hour of observation are mostly a little higher than the lowest relative humidity, but for hours between 1200 and 1500 local apparent natural time the difference is, generally, small. Provided a suitable choice of hours has been possible the values given in columns 1 and 8 are closely associated in time, and so are those in columns 2 and 7. At a few places the local climate actually produces higher relative humidities in the afternoon than in the morning.

Precipitation

"Precipitation" includes any deposit of moisture from the atmosphere. Rain, snow and hail are by far the commonest forms, but other forms such as dew and hoar-frost do contribute to the amounts measured. The amounts of precipitation given in columns 9, 10 and 11 indicate the amount of liquid deposit (rain, dew)

and the water equivalent of solid deposit (snow, hail, hoar-frost and rime). The values are the depths to which a flat, level surface would be covered with water if there were no losses due to evaporation, run-off or drainage.

In columns 10 and 11 the terms "24 hr." and "days" refer to periods of 24 hr. between scheduled readings of the rain-gauge and are not coincident with the civil day.

The entries in column 11 correspond to various countries' definitions of a "rain-day" or "day with rain". These definitions unfortunately vary from country to country, but in each case the criterion on which the figures are based is stated at the head of the column.

Standard of time

The difference between the Local Mean Time (L.M.T.) at two places depends only on their difference in longitude. Since the earth makes one complete revolution in 24 hr., a difference of 15° in longitude corresponds to a time difference of 1 hr. In order to avoid the inconvenience which would arise if each place adopted its own L.M.T., the system of Zone Time was introduced, and is now almost universally adopted. Under this system, national standards of time differ from one another by multiples of $\frac{1}{4}$ hr. or 1 hr., corresponding with $7\frac{1}{2}^{\circ}$ or 15° of longitude.

Since the apparent motion of the sun is from east to west, the standard time used in zones east of Greenwich is ahead of (i.e. a later hour than) Greenwich Mean Time (G.M.T.) and west of Greenwich is behind (i.e. an earlier hour than) G.M.T. at the rate of 1 hr. for every 15° of longitude.

All times printed in the tables refer to the nearest standard meridian which is always a whole multiple of $7\frac{1}{2}^{\circ}$ east or west of Greenwich. Thus, for a station in 71°W . the time of $67\frac{1}{2}^{\circ}\text{W}$. is used whereas for a station in 72°W . the time of 75°W . is used.

Position and height

The positions and heights of the stations above (or below) mean sea level are given at the top of each table.

Changes of site of a number of stations have occurred during the period of observations; but, in the case of the stations selected for inclusion in this work, the changes are not considered to be significant, and are therefore not specified in the headings which give only the latest published position of each station.

Period of years and number of years of observation

In all cases the most recently published statistics of a country have been studied first, and accepted for publication in this work if the period of years used was both recent and of a reasonable length.

When means were not readily available the observational data have been worked up from monthly records, the most recent 30-year period being used for this purpose.

In other cases (if both the above methods failed) tables were requested from the Meteorological Service concerned. The information obtained in this way has been listed in the Bibliography as manuscript data supplied by the respective Meteorological Services.

For a number of stations there are unavoidable breaks in the overall period of years, but breaks of less than five years have not been specified in the table headings. The actual number of years within the overall period for which data could be used in the case of each element is shown at the foot of each column in the tables. There are a few cases where the overall period is not accurately known and could not be given: this explains the cases where no period is quoted.

Bibliography

The numbers which appear in the rectangle at the top of column 1 of each table refer to the references listed at the end of the volume.

The references have been grouped under country headings to enable a student to obtain a useful list of books concerning the area in which he is interested without undue labour. This arrangement allows of certain books being referred to twice under different countries. Numbers are consecutive throughout. The books have been listed in order of importance (where this was practicable).

Contents and index

The tables have been arranged alphabetically within each country except in the case of very large countries where they have been arranged alphabetically within each state or province. Countries and provinces are arranged alphabetically as shown in the contents pages.

The index is arranged to facilitate reference; all cross references have been avoided, and where a place has more than one name an effort has been made to list all such names in the index and in the heading of the tables.

In the index the names of the countries and oceans are shown in capital letters and of provinces or states, and place names in ordinary type.
