

STORM SIGNALS.

RETURN to an Order of the Honourable The House of Commons,
dated 18 June 1874;—for,

10867
2

RETURNS “showing the LIST of PLACES to which TELEGRAPHIC WEATHER
INTELLIGENCE was sent in 1873, arranged according to Coasts :”
“And, showing the Number of TELEGRAMS sent to each STATION, and the
STORMS reported on the COASTS of the BRITISH ISLANDS, in 1873 (in
continuation of Parliamentary Paper, No. 152, of Session 1873).”

Board of Trade, }
29 July 1874. }

T. H. FARRER.

(Mr. Cavendish Bentinck.)

Ordered, by The House of Commons, to be Printed,
18 June 1874.

The following relation of the velocity of the wind as measured by a Robinson
anemometer of large size, and the force according to Mr. F. Beaufort's scale,
has been given up in the Meteorological Office from observations carried out at
Hobart and Tairua, and may be considered as approximately correct.

MEMORANDUM.

THE following pages contain a statement of all the telegrams conveying intelligence of weather issued by the Meteorological Office in the year 1873, and also of all the storms experienced on the coasts of the British Islands during the same period.

The facts on which the account of the storms has been based are,—

I. The continuous records of the direction and velocity of the wind furnished by the self-registering anemographs, on Dr. Robinson's principle, erected by the Meteorological Committee at 10 stations distributed over the United Kingdom, viz.: Kew, Yarmouth, Falmouth, Stonyhurst, Holyhead, Glasgow, Aberdeen, Sandwick Manse (Orkneys), Armagh, and Valencia; as well as at the stations of Alnwick Castle, Seaham Harbour, and Halifax, the results from which are supplied respectively by the kindness of the Duke of Northumberland, the Marquis of Londonderry, and L. J. Crossley, Esq.

II. The observations taken at the telegraph reporting stations (29 in number) situated in these islands.

III. Reports furnished by certain volunteer observers which have been received at the Meteorological Office.

The office is without accurate information as to the wind on the west coast of Ireland, generally; from Valencia to Lough Foyle, as well as on the west coast of Scotland, from the Mull of Cantyre to Cape Wrath, with the single exception of that received from its telegraphic reporting station at Stornoway.

The only stations at which the drum is hoisted within the above limits are Tralee, Limerick, and Galway, so that it is evident that the districts in question cannot be represented in the Return now submitted.

The scales, according to which the violence of the gales is estimated, are two in number, and are as follows:—

SCALES OF WIND.

FORCE, BEAUFORT SCALE.				Approximate Velocity. Miles per Hour.	
0. Calm	- - - - -	- - - - -	- - - - -	0	- - 0 to 5
1. Light air	- - - - -	Or, just sufficient to give steering way.	- - - - -	1	- - 6 to 10
2. Light breeze	- - - - -	Or, that in which a well- conditioned man-of-war, with all sail set, and clean full, would go in smooth water from -	1 to 2 knots	2	- - 11 to 15
3. Gentle breeze	- - - - -		3 to 4 knots	3	- - 16 to 20
4. Moderate breeze	- - - - -		5 to 6 knots	4	- - 21 to 25
5. Fresh breeze	- - - - -	Or, that to which she could just carry in chase, full and by - - - - -	Royals, &c.	5	- - 26 to 30
6. Strong breeze	- - - - -		Single-reefed topsails and top- gallant sails.	6	- - 31 to 36
7. Moderate gale	- - - - -		Double-reefed topsails, jib, &c.	7	- - 37 to 44
8. Fresh gale	- - - - -	Or, that which would reduce her to storm-staysails.	Triple-reefed topsails, &c.	8	- - 45 to 52
9. Strong gale	- - - - -		Close-reefed topsails and courses.	9	- - 53 to 60
10. Whole gale	- - - - -	Or, that with which she could scarcely bear close-reefed main-topsail and reefed fore- sail.	- - - - -	10	- - 61 to 69
11. Storm	- - - - -	Or, that which would reduce her to storm-staysails.	- - - - -	11	- - 70 to 80
12. Hurricane	- - - - -	Or, that which no canvas could withstand.	- - - - -	12	- - 80 and upwards.

The foregoing relation of the velocity of the wind, as measured by a Robinson's anemograph of large size, and its force, according to Sir F. Beaufort's scale, has been drawn up in the Meteorological Office from observations carried on at Holyhead and Yarmouth, and may be considered as approximately correct.

The

The principles of the system of warnings followed in 1873 are fully explained in Parliamentary Paper, No. 10, dated 25th November 1867, in which (Letter 9, from the Meteorological Committee to the Board of Trade) it is said, "The signal would be simply of a warning nature, and, without conveying the impression that the storm would necessarily strike the port where it was hoisted, would imply that extra caution in navigation was requisite." The Committee therefore would consider that extra caution in navigation would be necessary for coasters and fishing boats when the force of the wind reaches No. 8 of Beaufort's Scale, or even No. 7, while no serious danger can be said to exist unless the force reaches 9.

All observations of the wind in which the force exceeded 7 (a moderate gale), or the velocity exceeded 40 miles an hour, have been quoted as instances of the occurrence of a gale, but it has not been considered that the drum was hoisted late or was hauled down too soon unless the force of 9 (a strong gale) or the velocity of 50 miles an hour was reached prior to the issue of the order to hoist, or subsequent to the issue of the order to lower.

With reference to the definition of a serious gale, as force 9, which agrees with that adopted by the Board of Trade, a further limitation has been taken. The experience of the office has shown that at exposed stations, such as Holyhead and Sandwick Manse, the force of the wind is exceptionally strong, while it is exceptionally weak at inland stations, such as Kew and Armagh.

It is therefore fair to assume that the occurrence of a velocity of 50 miles an hour at Holyhead or Sandwick respectively does not in itself prove the prevalence of a strong gale on the whole line of coast of St. George's Channel and the Irish Sea, or on the east coast of Scotland, as the case may be.

In the Summary, pp. 24 to 29, all cases in which the signal has been shown to be partially late by one single report of force 9, or of the velocity of 50 miles, have been specially noted in the remarks.

The converse modification of increasing the velocities reported at inland stations has not been carried out, owing to the absence of sufficient information as to the co-efficients which should be used in each case to obtain the true velocity of the wind on the coast. Investigations are in progress in reference to this point.

The service of meteorological telegraphy is subject to a constantly recurring interruption, by the fact of no telegrams being received on Sundays. It should be borne in mind that even if attendance were given at the office on that day, it would not be possible to render generally available to the public the telegraphic intelligence which might be issued. As a rule, the telegraphic offices at the seaports and fishing stations are closed on Sundays at noon, about which time the telegrams from the Meteorological Office would usually reach the coast.

The Summary, p. 29, shows that the total per-centage of success is nearly identical with that for 1872, and far higher than those for 1871 and 1870 (Parl. Papers, No. 504, 1871; No. 152, 1873).

The following are the respective figures:—

	Warnings justified by subsequent Gales.	Warnings justified by subsequent Strong Winds.	Total Warnings justified.	Warnings not justified by subsequent Weather.
1870	46.7	21.7	68.4	22.4
1871	46.	17.7	63.7	22.
1872	61.	19.5	80.5	11.9
1873	45.2	34.	79.2	16.8

It will be seen that there is a serious difference between the years 1872 and 1873 as regards the way in which the proportion of the successful warnings (identical in the two years) is distributed between those justified by gales and those only justified by strong winds.

The explanation of this is to be found in the peculiar character of the weather during the greater part of the year; the paths of the storm-centres often lying to the northward of the United Kingdom, so that our stations felt the barometrical and other meteorological disturbances, but were not exposed to the full brunt of the storms.

The office having to issue its warnings on the first signs of the approach of storms, has in several cases only to show winds of forces 6 and 7 as justifications of its cautionary telegrams. The warnings, therefore, were perfectly right in principle, though hardly necessary for large sea-going ships, as distinguished from yachts, coasters, and fishing boats.

As an illustration of the foregoing statement, it is of interest to show that while the total number of gales reported on all coasts in 1872 was 174, in 1873 it was only 138, as will be seen from the Summaries, the falling off being mainly in the number of gales reported in Ireland, while in Scotland, on the contrary, there was an actual increase in 1873, as compared with 1872.

It will be noticed that in the cases of two very serious gales, those of 18th January and 16th December, the storms came on so rapidly during the night time, subsequent to the afternoon reports of the previous day, that no warning could be issued by the office; and it does not seem that the funds at present at the disposal of the office will enable it to anticipate the arrival of such gales as the two in question, as for that purpose much more frequent telegrams from the coast would be required.

The results of the four years' work will, it is hoped, show that while the office cannot be expected to be able to give timely warning of *all* gales, it has yet been able to give such information as would, if attended to, have enabled our coasting seamen to avoid the violence of almost all the serious storms which have visited our coasts.

STORM SIGNALS.

LIST of PLACES to which TELEGRAPHIC WEATHER INTELLIGENCE was sent in 1873, arranged according to COASTS.

COASTS.			PLACES.	COASTS.			PLACES.
IRELAND	-	South	New Ross.	ENGLAND	-	West	Holyhead.
			Dunmore, East.				Carnarvon.
Ditto	-	East	Dungarvan.	Ditto	-	South (Devon and Cornwall).	Port Dinorwic.
			Youghal.				Aberystwith.
			Queenstown.				Milford.
			Cork.				Pembrey.
			Passage.				Llanelly.
			Tralee.				Swansea.
			Limerick.				Briton Ferry.
			Galway.				Porthcawl.
			Belfast.				Penarth.
			Howth.				Cardiff.
SCOTLAND	-	East	Kingstown.	Ditto	-	South (Devon and Cornwall).	Newport.
			Kirkwall.				Weston-super-Mare.
			Inverness.				Burnham.
			Nairn.				Ilfracombe.
			Burghead.				Barnstaple.
			Lossiemouth.				Port Isaac.
			Buckie.				Boscastle.
			Portsoy.				Newquay.
			Banff.				Hayle.
			Fraserburgh.				Pendennis.
Ditto	-	West (Clyde)	Peterhead.	Ditto	-	South	Scilly.
			Aberdeen.				Penzance.
			Stonehaven.				Falmouth.
			Montrose.				Plymouth.
			Broughty Ferry.				Teignmouth.
			St. Andrews.				Exeter.
			Dundee.				Exmouth.
			Anstruther.				Guernsey.
			St. Monance.				St. Helier, Jersey.
			Burntisland.				Gorey, Jersey.
ENGLAND	-	North West	Alloa.	Ditto	-	South-east	Weymouth.
			Grangemouth.				Poole.
			Bo'ness.				Cowes.
			Granton.				Ventnor.
			Leith.				Portsmouth.
			Fisherrow.				Littlehampton.
			Dunbar.				Brighton.
			Eyemouth.				Newhaven.
			Glasgow.				Hastings.
			Greenock.				Rye.
Ditto	-	West (Clyde)	Rothesay.	Ditto	-	East	Dover.
			Campbelton.				Ipswich.
			Girvan.				Harwich.
			Silloth.				Chatham.
			Maryport.				Sheerness.
			Workington.				Faversham.
			Whitehaven.				Tynemouth.
			Ramsey.				South Shields.
			Douglas.				Sunderland.
			Castletown.				Middlesborough.
Ditto	-	North West	Barrow.	Ditto	-	East	Redcar.
			Morecambe.				Whitby.
			Fleetwood.				Filey.
			Blackpool.				Withernsea.
			Lytham.				Hull.
			Runcorn.				Goole.
			Southport.				Grimshy.
			Liverpool.				Boston.
			Queensferry.				Sutton Bridge.
			Hawarden.				Lynn.
Ditto	-	North West	Mostyn.	Ditto	-	East	Cromer.
			Port Penrhyn.				Yarmouth.
Ditto	-	North West		Ditto	-	East	Southwold.

WEATHER INTELLIGENCE.

RETURN to an Order of the Honourable The House of Commons,
dated 20 May 1875;—for,

RETURNS “showing the LIST of PLACES to which TELEGRAPHIC WEATHER
INTELLIGENCE was sent in 1874, arranged according to Coasts:”

“And, showing the Number of TELEGRAMS sent to each STATION, and the
STORMS reported on the COASTS of the BRITISH ISLANDS, in 1874 (in
continuation of Parliamentary Paper, No. 223, of Session 1874).”

Board of Trade, }
20 May 1875. }

T. H. FARRER.

(Mr. Cavendish Bentinck.)

Ordered, by The House of Commons, to be Printed,
20 May 1875.

The following table shows the number of telegrams sent to each station, and the storms reported on the coasts of the British Islands, in 1874 (in continuation of Parliamentary Paper, No. 223, of Session 1874).

(Mr. Cavendish Bentinck.)

Ordered, by The House of Commons, to be Printed,
18 June 1874.

MEMORANDUM.

THE following pages contain a statement of all the telegrams conveying intelligence of weather issued by the Meteorological Office in the year 1874, and also of all the storms experienced on the coasts of the British Islands during the same period.

The facts on which the account of the storms has been based are,—

I. The continuous records of the direction and velocity of the wind furnished by the self-registering anemographs, on Dr. Robinson's principle, erected by the Meteorological Committee at 10 stations distributed over the United Kingdom, viz.: Kew, Yarmouth, Falmouth, Stonyhurst, Holyhead, Glasgow, Aberdeen, Sandwick Manse (Orkneys), Armagh, and Valencia; as well as at the stations of Alnwick Castle, Seaham Harbour, and Halifax, the results from which are supplied respectively by the kindness of the Duke of Northumberland, the Marquis of Londonderry, and L. J. Crossley, Esq.

II. The observations taken at the telegraphic reporting stations (29 in number) situated in these islands.

III. Reports furnished by certain volunteer observers which have been received at the Meteorological Office.

The office is without accurate information as to the wind on the west coast of Ireland, generally, from Valencia to Lough Foyle, as well as on the west coast of Scotland, from the Mull of Cantyre to Cape Wrath, with the single exception of that received from its telegraphic reporting station at Stornoway.

The only stations at which the signals are hoisted within the above limits are Tralee, Limerick, and Galway, so that it is evident that the districts in question cannot be represented in the Return now submitted.

The scales, according to which the violence of the gales is estimated, are two in number, and are as follows:—

SCALES OF WIND.

FORCE, BEAUFORT SCALE.				Approximate Velocity.
				Miles per Hour.
0. Calm	-	-	-	0
1. Light air	-	-	-	1
2. Light breeze	-	-	-	2
3. Gentle breeze	-	-	-	3
4. Moderate breeze	-	-	-	4
5. Fresh breeze	-	-	-	5
6. Strong breeze	-	-	-	6
7. Moderate gale	-	-	-	7
8. Fresh gale	-	-	-	8
9. Strong gale	-	-	-	9
10. Whole gale	-	-	-	10
11. Storm	-	-	-	11
12. Hurricane	-	-	-	12

The foregoing relation of the velocity of the wind, as measured by a Robinson's anemograph of large size, and its force, according to Sir F. Beaufort's scale, has been drawn up in the Meteorological Office from observations carried on at Holyhead and Yarmouth, and may be considered as approximately correct.

The principles of the system of warnings followed in 1874 are fully explained in Parliamentary Paper, No. 10, dated 25th November 1867, in which (Letter 9, from the Meteorological Committee to the Board of Trade) it is said, "The signal would be simply of a warning nature, and, without conveying the impression that the storm would necessarily strike the port where it was hoisted, would imply that extra caution in navigation was requisite." The Committee therefore would consider that extra caution in navigation would be necessary for coasters and fishing boats when the force of the wind reaches No. 8 of Beaufort's Scale, or even No. 7, while no serious danger can be said to exist unless the force reaches 9.

All observations of the wind in which the force exceeded 7 (a moderate gale), or the velocity exceeded 40 miles an hour, have been quoted as instances of the occurrence of a gale, but it has not been considered that the signal was hoisted *late* or was *hauled down too soon* unless the force of 9 (a strong gale) or the velocity of 50 miles an hour was reached *prior* to the issue of the order to hoist, or *subsequent* to the issue of the order to lower.

With reference to the definition of a serious gale, as force 9, which agrees with that adopted by the Board of Trade, a further limitation has been taken. The experience of the office has shown that at exposed stations, such as Holyhead and Sandwick Manse, the force of the wind is exceptionally strong, while it is exceptionally weak at inland stations, such as Kew and Armagh.

It is therefore fair to assume that the occurrence of a velocity of 50 miles an hour at Holyhead or Sandwick respectively does not in itself prove the prevalence of a strong gale on the whole line of coast of St. George's Channel and the Irish Sea, or on the east coast of Scotland, as the case may be.

In the Summary, pp. 26 to 31, all cases in which the signal has been shown to be partially late by one single report of force 9, or of the velocity of 50 miles, have been specially noted in the remarks.

The converse modification of increasing the velocities reported at inland stations, in order to obtain an improved estimate of the force of wind on the coast, has not been carried out, owing to the absence of sufficient information as to the co-efficients which should be used in each case to obtain the true velocity of the wind on the coast.

The service of meteorological telegraphy is subject to a constantly recurring interruption, by the fact of no telegrams being received on Sundays. It should be borne in mind that even if attendance were given at the office on that day, it would not be possible to render generally available to the public the telegraphic intelligence which might be issued. As a rule, the telegraphic offices at the seaports and fishing stations are closed on Sundays at noon, about which time the telegrams from the Meteorological Office would usually reach the coast.

The Summary, p. 31, shows that the total per-centage of success is nearly identical with that for 1872, and far higher than those for 1871 and 1870 (Parl. Papers, No. 504, 1871; No. 152, 1873).

The following are the respective figures:—

	WARNINGS JUSTIFIED			Warnings not justified by subsequent Weather.
	By subsequent Gales.	By subsequent Strong Winds.	Total.	
1870	46.7	21.7	68.4	22.4
1871	46.	17.7	63.7	22.
1872	61.	19.5	80.5	11.9
1873	45.2	34.	79.2	16.8
1874	45.4	32.8	78.2	16.4

It will be seen that the figures for 1874 are almost identical with those for 1873, and that the total per-centage of success, almost 80 per cent., has been maintained

maintained during the past three years. The difference between the results as regards the warnings, justified by subsequent gales in 1872, as compared with 1873 and 1874, is due to the fact that in the preparation of the Return for that year a lower force of wind was taken as indicating a gale, and therefore a complete justification of the warning, than has subsequently been the case.

The office having to issue its warnings on the first signs of the approach of storms has in several cases only to show winds of forces 6 and 7 as justifications of its cautionary telegrams. The warnings, therefore, were perfectly right in principle, though hardly necessary for large sea-going ships, as distinguished from yachts, coasters, and fishing boats.

At the beginning of March the use of the cone, in addition to the drum, as an indication of the direction of the wind in a gale, was resumed.

The Return differs from that of previous years in that the duration of each gale at the observatories is given, *i.e.*, the number of hours during which the velocity exceeded 50 miles; it will be seen from this, that in many cases where the warnings were late, or were not issued at all, the gale which was felt was of little consequence.

It will be noticed that in the cases of one very serious gale, that of 21st October, the storm came on so rapidly during the night time, subsequent to the afternoon reports of the previous day, that no warning could be issued by the office; and it does not seem that the funds at present at the disposal of the office will enable it to anticipate the arrival of such gales as that in question, and a few others which will be seen in the Table, *e.g.*, that of November 28th, in the south of England, as for that purpose much more frequent telegrams from the coast would be required.

The results of the five years' work will, it is hoped, show that while the office cannot be expected to be able to give timely warning of *all* gales, it has yet been able to give such information as would, if attended to, have enabled our coasting seamen to avoid the violence of almost all the serious storms which have visited our coasts.

STORM SIGNALS.

LIST of PLACES to which TELEGRAPHIC WEATHER INTELLIGENCE was sent in 1874, arranged according to COASTS.

WEATHER INTELLIGENCE.

RETURN to an Order of the Honourable The House of Commons,
dated 11 July 1876;—for,

RETURNS “showing the LIST of PLACES to which TELEGRAPHIC WEATHER
INTELLIGENCE was sent in 1875, arranged according to Coasts:”

“And, showing the Number of TELEGRAMS sent to each STATION, and the
STORMS reported on the COASTS of the BRITISH ISLANDS, in 1875 (in
continuation of Parliamentary Paper, No. 210, of Session 1875).”

Board of Trade, }
11 July 1876. }

T. H. FARRER.

(Sir Charles Adderley.)

Ordered, by The House of Commons, to be Printed,
11 July 1876.

WEATHER INTELLIGENCE.

RETURNS showing the LIST of PLACES to which
TELEGRAPHIC WEATHER INTELLIGENCE was sent
in 1874, arranged according to Coasts; and,
showing the Number of TELEGRAMS sent to each
Station, and the STORMS reported on the Coasts
of the BRITISH ISLANDS, in 1874 (in continuation
of Parliamentary Paper, No. 228, of Session
1874).

(Mr. Cecilish Bentinck.)

Ordered, by The House of Commons, to be Printed,
20 May 1875.

210.

Under 3 oz.

MEMORANDUM.

THE following pages contain a statement of all the telegrams conveying intelligence of weather issued by the Meteorological Office in the year 1875, and also of all the storms experienced on the coasts of the British Islands during the same period.

The facts on which the account of the storms has been based are,—

I. The continuous records of the direction and velocity of the wind furnished by the self-registering anemographs, on Dr. Robinson's principle, erected by the Meteorological Committee at 10 stations distributed over the United Kingdom, viz.: Kew, Yarmouth, Falmouth, Stonyhurst, Holyhead, Glasgow, Aberdeen, Sandwick Manse (Orkneys), Armagh, and Valencia; as well as at the stations of Alnwick Castle, Seaham Harbour, and Halifax, the results from which are supplied respectively by the kindness of the Duke of Northumberland, the Marquis of Londonderry, and L. J. Crossley, Esq.

II. The observations taken at the telegraphic reporting stations (29 in number) situated in these islands.

III. Reports furnished by certain volunteer observers which have been received at the Meteorological Office.

The office is without accurate information as to the wind on the west coast of Ireland, generally, from Valencia to Lough Foyle, as well as on the west coast of Scotland, from the Mull of Cantyre to Cape Wrath, with the single exception of that received from its telegraphic reporting station at Stornoway.

The only stations at which the signals are hoisted within the above limits are Tralee, Limerick, and Galway, so that it is evident that the districts in question cannot be represented in the Return now submitted.

The scales, according to which the violence of the gales is estimated, are two in number, and are as follows:—

SCALES OF WIND.

FORCE, BEAUFORT SCALE.				Approximate Velocity.	
				Miles per Hour.	
0. Calm	-	-	-	0	3
1. Light air	-	-	-	1	8
2. Light breeze	-	-	-	2	13
3. Gentle breeze	-	-	-	3	18
4. Moderate breeze	-	-	-	4	23
5. Fresh breeze	-	-	-	5	28
6. Strong breeze	-	-	-	6	34
7. Moderate gale	-	-	-	7	40
8. Fresh gale	-	-	-	8	48
9. Strong gale	-	-	-	9	56
10. Whole gale	-	-	-	10	65
11. Storm	-	-	-	11	75
12. Hurricane	-	-	-	12	90

The foregoing relation of the velocity of the wind, as measured by a Robinson's anemograph of large size, and its force, according to Sir F. Beaufort's scale, has

has been drawn up in the Meteorological Office from observations carried on at Holyhead and Yarmouth, and may be considered as approximately correct.

The principles of the system of warnings followed in 1874 are fully explained in Parliamentary Paper, No. 10, dated 25th November 1867, in which (Letter 9, from the Meteorological Committee to the Board of Trade) it is said, "The signal would be simply of a warning nature, and, without conveying the impression that the storm would necessarily strike the port where it was hoisted, would imply that extra caution in navigation was requisite." The Committee therefore would consider that extra caution in navigation would be necessary for coasters and fishing boats when the force of the wind reaches No. 8 of Beaufort's Scale, or even No. 7, while no serious danger can be said to exist unless the force reaches 9.

All observations of the wind in which the force exceeded 7 (a moderate gale), or the velocity exceeded 40 miles an hour, have been quoted as instances of the occurrence of a gale, but it has not been considered that the signal was hoisted late or was hauled down too soon unless the force of 9 (a strong gale) or the velocity of 50 miles an hour was reached prior to the issue of the order to hoist, or subsequent to the issue of the order to lower.

With reference to the definition of a serious gale, as force 9, which agrees with that adopted by the Board of Trade, a further limitation has been taken. The experience of the office has shown that at exposed stations, such as Holyhead and Sandwick Manse, the force of the wind is exceptionally strong, while it is exceptionally weak at inland stations, such as Kew and Armagh.

It is therefore fair to assume that the occurrence of a velocity of 50 miles an hour at Holyhead or Sandwick respectively does not in itself prove the prevalence of a strong gale on the whole line of coast of St. George's Channel and the Irish Sea, or on the east coast of Scotland, as the case may be.

In the Summary, pp. 22 to 27, all cases in which the signal has been shown to be partially late by one single report of force 9, or of the velocity of 50 miles, have been specially noted in the remarks.

The converse modification of increasing the velocities reported at inland stations, in order to obtain an improved estimate of the force of wind on the coast, has not been carried out, owing to the absence of sufficient information as to the co-efficients which should be used in each case to obtain the true velocity of the wind on the coast.

The service of meteorological telegraphy is subject to a constantly recurring interruption, by the fact of no telegrams being received on Sundays. It should be borne in mind that even if attendance were given at the office on that day, it would not be possible to render generally available to the public the telegraphic intelligence which might be issued. As a rule, the telegraphic offices at the seaports and fishing stations are closed on Sundays at noon, about which time the telegrams from the Meteorological Office would usually reach the coast.

The Summary, p. 27, shows that the total per-centage of success is nearly the same as in the last three years, and far higher than those for 1871 and 1870 (Parl. Papers, No. 504, 1871; No. 152, 1873).

The following are the respective figures:—

	WARNINGS JUSTIFIED			Warnings not justified by subsequent Weather.
	By subsequent Gales.	By subsequent Strong Winds.	Total.	
1870	46.7	21.7	68.4	22.4
1871	46.	17.7	63.7	22.
1872	61.	19.5	80.5	11.9
1873	45.2	34.	79.2	16.8
1874	45.4	32.8	78.2	16.4
1875	41.1	35.1	76.2	21.0

It will be seen that a total proportion of success, above 75 per cent., has been maintained during the past four years. The difference between the results as regards the warnings, justified by subsequent gales in 1872, as compared with the later years, is due to the fact that in the preparation of the Return for that year a lower force of wind was taken as indicating a gale, and there appeared to be, therefore, a more complete justification of the warning, than has subsequently been the case.

The office having to issue its warnings on the first signs or the approach of storms has in several cases only to show winds of forces 6 and 7 as justifications of its cautionary telegrams. The warnings, therefore, were perfectly right in principle, though hardly necessary for large sea-going ships, as distinguished from yachts, coasters, and fishing boats.

In this Return, as in that for 1874, the duration of each gale at the observatories is given, *i.e.*, the number of hours during which the velocity exceeded 50 miles; it will be seen from this, that in many cases where the warnings were late, or were not issued at all, the gale which was felt was of little consequence.

The results of the six years' work will, it is hoped, show that while the office cannot be expected to be able to give timely warning of *all* gales, it has yet been able to give such information as would, if attended to, have enabled our coasting seamen to avoid the violence of almost all the serious storms which have visited our coasts.

WEATHER INTELLIGENCE.

RETURN to an Order of the Honourable The House of Commons,
dated 10 August 1877;—for,

RETURNS “showing the LIST of PLACES to which TELEGRAPHIC WEATHER
INTELLIGENCE was sent in 1876, arranged according to Coasts:”

“And, showing the Number of TELEGRAMS sent to each STATION, and the
STORMS reported on the COASTS of the BRITISH ISLANDS, in 1876 (in
continuation of Parliamentary Paper, No. 351, of Session 1876).”

Board of Trade,
10 August 1877.

T. H. FARRER.

(Mr. Edward Stanhope.)

Ordered, by The House of Commons, to be Printed,
10 August 1877.

WEATHER INTELLIGENCE.

RETURNS showing the LIST of PLACES to which
TELEGRAPHIC WEATHER INTELLIGENCE was sent
in 1876, arranged according to Coasts; and,
showing the Number of TELEGRAMS sent to each
Station, and the STORMS reported on the Coasts
of the BRITISH ISLANDS, in 1876 (in continuation
of Parliamentary Paper, No. 210, of Session
1876).

(Sir Charles Alderley.)

Ordered, by The House of Commons, to be Printed,
11 July 1876.

351.
Under 3 oz.

MEMORANDUM.

THE following pages contain a statement of all the telegrams conveying intelligence of weather issued by the Meteorological Office in the year 1876, and also of all the storms experienced on the coasts of the British Islands during the same period.

The facts on which the account of the storms has been based are,—

I. The continuous records of the direction and velocity of the wind furnished by the self-registering anemographs, on Dr. Robinson's principle, erected by the Meteorological Committee at 10 stations distributed over the United Kingdom, viz.: Kew, Yarmouth, Falmouth, Stonyhurst, Holyhead, Glasgow, Aberdeen, Sandwick Manse (Orkneys), Armagh, and Valencia; as well as at the stations of Alnwick Castle, Seaham Harbour, and Halifax, the results from which are supplied respectively by the kindness of the Duke of Northumberland, the Marquis of Londonderry, and L. J. Crossley, Esq.

II. The observations taken at the telegraphic reporting stations (29 in number) situated in these islands.

III. Reports furnished by certain volunteer observers which have been received at the Meteorological Office.

IV. The records kept at certain lightships and lighthouses on the coast, for the loan of which the committee is indebted to the kindness of the Trinity House, the Commissioners of Irish Lights, and to the Board of Northern Lights.

The Stations in question were,—

England: *Lightships*.—Kentish Knock, Galloper, Varne, Owers, Seven Stones, Scarweather, Morecambe Bay.

Ireland: *Lightships*.—Kish, Coningbeg, Daunt's Rock.

Scotland: *Lighthouses*.—Pentland Skerries, Kinnaird Head, Bell Rock, Sanda, Mull of Cantyre.

The office is without accurate information as to the wind on the west coast of Ireland, generally, from Valencia to Lough Foyle, as well as on the west coast of Scotland, from the Mull of Cantyre to Cape Wrath, with the single exception of that received from its telegraphic reporting station at Stornoway.

The only stations at which the signals are hoisted within the above limits are Tralee, Limerick, and Galway, so that it is evident that the districts in question cannot be represented in the Return now submitted.

The scales, according to which the violence of the gales is estimated, are two in number, and are as follows:—

SCALES OF WIND.

FORCE, BEAUFORT SCALE.				Approximate Velocity.	
				Miles per Hour.	
0. Calm	- - -	- - -	- - -	0	- - 3
1. Light air	- - -	Or, just sufficient to give steerage way.	- - -	1	- - 8
2. Light breeze	- - -	Or, that in which a well-conditioned man-of-war, with all sail set, and clean full, would go in smooth water from -	1 to 2 knots	2	- - 13
3. Gentle breeze	- - -		3 to 4 knots	3	- - 18
4. Moderate breeze	- - -		5 to 6 knots	4	- - 23
5. Fresh breeze	- - -	Or, that to which she could just carry in chase, full and by - - -	Royals, &c.	5	- - 28
6. Strong breeze	- - -		Single-reefed topsails and top-gallant sails.	6	- - 34
7. Moderate gale	- - -		Double-reefed topsails, jib, &c.	7	- - 40
8. Fresh gale	- - -		Triple-reefed topsails, &c.	8	- - 48
9. Strong gale	- - -		Close-reefed topsails and courses.	9	- - 56
10. Whole gale	- - -	Or, that with which she could scarcely bear close-reefed main-topsail and reefed fore-sail.	- - -	10	- - 65
11. Storm	- - -	Or, that which would reduce her to storm-staysails.	- - -	11	- - 75
12. Hurricane	- - -	Or, that which no canvas could withstand.	- - -	12	- - 90

The foregoing relation of the velocity of the wind, as measured by a Robinson's anemograph of large size, and its force, according to Sir F. Beaufort's scale, has been drawn up in the Meteorological Office from observations carried on at Holyhead and Yarmouth, and may be considered as approximately correct.

The principles of the system of warnings followed in 1876 are fully explained in Parliamentary Paper, No. 10, dated 25th November 1867, in which (Letter 9, from the Meteorological Committee to the Board of Trade) it is said, "The signal would be simply of a warning nature, and, without conveying the impression that the storm would necessarily strike the port where it was hoisted, would imply that extra caution in navigation was requisite." The Committee, therefore, would consider that extra caution in navigation would be necessary for coasters and fishing boats when the force of the wind reaches No. 8 of Beaufort's Scale, or even No. 7, while no serious danger can be said to exist unless the force reaches 9.

All observations of the wind in which the force exceeded 7 (a moderate gale), or the velocity exceeded 40 miles an hour, have been quoted as instances of the occurrence of a gale, but it has not been considered that the signal was hoisted *late* or was *hauled down too soon* unless the force of 9 (a strong gale) or the velocity of 50 miles an hour was reached *prior* to the issue of the order to hoist, or *subsequent* to the issue of the order to lower.

With reference to the definition of a serious gale, as force 9, which agrees with that adopted by the Board of Trade, a further limitation has been taken. The experience of the office has shown that at exposed stations, such as Holyhead and Sandwick Manse, the force of the wind is exceptionally strong, while it is exceptionally weak at inland stations, such as Kew and Armagh.

It is therefore fair to assume that the occurrence of a velocity of 50 miles an hour at Holyhead or Sandwick respectively does not in itself prove the prevalence of a strong gale on the whole line of coast of St. George's Channel and the Irish Sea, or on the east coast of Scotland, as the case may be.

In the Summary, pp. 34 to 39, all cases in which the signal has been shown to be partially late by one single report of force 9, or of the velocity of 50 miles, have been specially noted in the remarks.

The converse modification of increasing the velocities reported at inland stations, in order to obtain an improved estimate of the force of wind on the coast, has not been carried out, owing to the absence of sufficient information as to the co-efficients which should be used in each case to obtain the true velocity of the wind on the coast.

In dealing with the lighthouse records, however, some discretion has necessarily been exercised, for some of these stations report extreme forces, for the

wind

wind, such as 11 or 12 of Beaufort's scale, at times when no gale of exceptional severity could possibly have occurred.

The service of Meteorological telegraphy up to end of 1875 had been subject to a constantly recurring interruption owing to the fact of no telegrams being received on Sundays. On the 1st of January 1876, a special service was commenced for the purpose of supplying to the "Times" a daily report at 6 p.m. from certain stations. This service is conducted on Sundays as on other days. The entire expense connected with it is about 500 l. a year, and this is borne by the proprietors of that newspaper.

These gentlemen have most liberally permitted the office to use the information collected and transmitted at their expense, for any scientific purposes for which it might be required, and the result has been that on many occasions storm warnings have been issued in the evening, and have thus enabled the office to give timely intimation of the approach of disturbances which had not shown themselves at the time of the preceding observations at 2 p.m., but which would have been felt as gales before noon next day, before which time, under other circumstances, the warnings could not have reached the coast, and would consequently have been too late.

It is mainly to these circumstances that the improvement in the results of the warnings in 1876, as compared with previous years, is to be attributed, and the Committee would here express their sincere thanks to the proprietors of the "Times" for the great assistance they have afforded to the service of storm warnings.

With reference to the question of Sunday telegraphy, the Committee in November 1876 determined to devote a portion of the available surplus funds in their hands to the maintenance of a regular Sunday service during the winter and spring of 1876-7. This system was only in operation for the last six weeks of 1876, but, as far as could be judged, the results were very satisfactory.

The Summary, p. 39, shows that the total per-centage of success in 1876 is decidedly higher than in any previous year.

The following are the respective figures:—

	WARNINGS JUSTIFIED			Warnings not justified by subsequent Weather.
	By subsequent Gales.	By subsequent Strong Winds.	Total.	
1870	46.7	21.7	68.4	22.4
1871	46.	17.7	63.7	22.
1872	61.	19.5	80.5	11.9
1873	45.2	34.	79.2	16.8
1874	45.4	32.8	78.2	16.4
1875	41.1	35.1	76.2	21.0
1876	61.1	22.8	83.9	14.0

The reasons for this marked improvement of the results as compared with previous years, are partly to be found in the circumstances already explained of the receipt of information at more frequent intervals from the reporting stations; partly, however, they are attributable to the increased facilities for information as to the weather prevailing at sea, which have been afforded by the Lighthouse Registers.

The office having to issue its warnings on the first signs of the approach of storms, has, in several cases, only to show winds of forces six and seven as justification of its cautionary telegrams. The warnings, therefore, were perfectly right in principle, though hardly necessary for large sea-going ships, as distinguished from yachts, coasters, and fishing boats.

The results of the seven years' work will, it is hoped, show that while the office cannot be expected to be able to give timely warning of *all* gales, it has yet been able to give such information as would, if attended to, have enabled our coasting seamen to avoid the violence of almost all the serious storms which have visited our coasts.
